

What is Claimed:

1. A CO<sub>2</sub> releasing composition that can be incorporated into the packaging for carbonated beverages having a co-continuous interconnecting channel morphology comprising at least three components,

(a) wherein component A is selected from the group of polymers that are semicrystalline polymers and amorphous polymers, wherein the amorphous polymers have a shear modulus greater than about 8 MPa;

(b) wherein component B is a polymer;

(c) wherein components A and B are immiscible within each other and, if components A and B react after mixing, components A and B are immiscible prior to reaction;

(d) wherein component C is a particle and a composition that has an ability to release CO<sub>2</sub>;

(e) wherein the volume fraction of component A represents at least about 50% by volume of the total volume of components A, B and C;

(f) wherein the preferential affinity between component B and component C is greater than between component A and component C;

(g) wherein at least two phases are formed, one phase is composed of a majority of component A, and the second phase is composed of a majority of component B and a majority of component C; and

(h) wherein the two phases form the co-continuous interconnecting channel morphology.

2. A CO<sub>2</sub> releasing composition that can be incorporated into the packaging for carbonated beverages comprising a CO<sub>2</sub> releasing component comprising a combination of a carbonate with an acid.
